

# Introduction to Cognitive Behavioural Therapy for Pain Management

## 11 January 2021

### Introduction

Pain is experienced by psychological aspects and tissue injury, which affects the well-being of an individual. The cognitive behavioural therapy course will equip healthcare professionals with the fundamental cognitive and behavioural skills when working with their patient with chronic pain conditions.

This course will cover the cognitive-behavioural techniques that focus on the physical and psychosocial symptoms associated to pain. At the end of the course, participants will be able to teach their patients on how to manage their pain on their own using the appropriate skills.

### Course Objectives

- Explain the evidence supporting a cognitive behavioural approach to pain care
- Demonstrate evidence-based cognitive behavioural strategies that can be integrated into the care of patients with musculoskeletal pain
- Identify appropriate self-report patient measures for pain Explain the three domains of pain catastrophizing (magnification, rumination, helplessness)
- Apply cognitive restructuring to assist patients with reframing their perspective on their pain experience
- Explain how to guide a patient through a mindful body scan technique

### Target Audience

Allied Health Professionals

### Course Outline
