

Case 32

56 year old female.
Right breast lump. Excision biopsy.
Sections from tumour (A, B).

Conclusions

- The incidence of PT subsequent to a diagnosis of FA on CNB is extremely low (*0.38%, 16 out of 4163 cases*).
- Most PT were categorized as benign (*14 benign, 2 borderline*).
- PT heterogeneity (e.g. FA-like areas) likely contributed to CNB-excision discrepancies.
- No pathologic features on CNB appeared to be prospectively predictive of PT at excision.
- Suspicious imaging features at time of CNB or on follow-up should prompt consideration for surgical excision.
- Diagnosing FA on CNB is reliable and safe, with adequate imaging correlation and follow-up.

A five-gene reverse transcription-PCR assay for pre-operative classification of breast fibroepithelial lesions

Wai Jin Tan¹, Igor Cima¹, Yukti Choudhury¹, Xiaona Wei¹, Jeffrey Chun Tatt Lim², Aye Aye Thike²,
Min-Han Tan¹ and Puay Hoon Tan^{2,3*}

Methods: We profiled the transcriptome of a training set of 48 formalin-fixed, paraffin-embedded fibroadenomas and phyllodes tumors and further designed 43 quantitative polymerase chain reaction (qPCR) assays to verify differentially expressed genes. Using machine learning to build predictive regression models, we selected a five-gene transcript set (*ABCA8*, *APOD*, *CCL19*, *FN1*, and *PRAME*) to discriminate between fibroadenomas and phyllodes tumors. We validated our assay in an independent cohort of 230 core biopsies obtained pre-operatively.

Results: Overall, the assay accurately classified 92.6 % of the samples (AUC = 0.948, 95 % CI 0.913–0.983, $p = 2.51E-19$), with a sensitivity of 82.9 % and specificity of 94.7 %.

FibroPhyllo™ Tissue Test

M

The performance of the FibroPhyllo™ Tissue Test in pre-operative classification of breast fibroepithelial lesions was validated in a cohort study of 230 core biopsies with at least 2 years of follow-up⁵.

DIAGNOSTICS

TEST PERFORMANCE

TEST REQUIREMENTS

- 1) FFPE Tissues - Core / Excisional Biopsies
 - Minimum 50 microns equivalent (e.g. 10 slides of 5 micron-thickness or 5 slides of 10 micron-thickness)
 - Slides uncharged and uncoated
- 2) Matched H&E slide with tumor region marked out
- 3) Matched histology report of tissue biopsy
- 4) Tissue curls are not **be** accepted

Validation of the Singapore nomogram for outcome prediction in breast phyllodes tumours in a large patient cohort

Tze Wei Chng,¹ Mihir Gudi,² Swee Ho Lim,³ HuiHua Li,⁴ Puay Hoon Tan⁵

J Clin Pathol 2018; 71: 125-128

Table 4 Cases with associated fibroadenoma-like areas or separate fibroadenomas

Year	Cases with concurrent fibroadenomas (separate fibroadenoma in ipsilateral or contralateral breasts, fibroadenoma-like areas within phyllodes tumours)	Cases with fibroadenoma-like areas within phyllodes tumours	Cases with separate fibroadenomas in ipsilateral or contralateral breasts
2013	11/26 (42.3%)	8/26 (30.8%) Benign: 12 Borderline: 0 Malignant: 0	3/26 (11.5%)
2014	13/23 (56.5%)	8/23 (34.8%) Benign: 6 Borderline: 1 Malignant: 1	5/23 (21.7%)
2015	16/29 (55.1%)	12/29 (41.4%) Benign: 6 Borderline: 1 Malignant: 1	4/29 (13.8%)
Total	40/78 (51.3%)	28/78 (35.9%)	12/78 (15.4%)

Summary

- Likelihood of phyllodes tumour following a core biopsy diagnosis of unambiguous fibroadenoma is very low.
- Occasional occurrences can be avoided by close clinicoradiological correlation, eg counselling for excision when a size threshold is exceeded, and when patient experiences symptoms, due to sampling limitations.
- Morphological parameters are helpful to some extent.
- Possibility of a molecular adjunctive test for arbitration.
